Charle

droplets while moving a recording head over a recording medium with a plurality of ink ejection nozzles arranged thereon, said method comprising the steps of:

before converting the vector data to the raster data, checking by said interpreter whether the specified data pattern indicates solid-drawing in the thick line or the filled-in area for which the drawing is indicated;

if the data pattern specified to a particular thick line or filled-in area indicates solid-drawing, changing the data pattern for that particular thick line or filled-in area to a data pattern of a lower-density for preventing an ink splash during printing; and

converting the vector data of the thick line or the filledin area into raster data based on the vector data and the data pattern when ejecting ink droplets according to the raster data;

wherein said recording method is performed while operating said recording head in a single pass recording mode.

7. (Amended Three times) An ink jet recording device comprising:

an interpreter for analyzing a command and data which indicate a drawing of a thick line or a filled-in area;

means for converting vector data of the thick line or the filled-in area into raster data based on the vector data and a specified data pattern which contains a predetermined matrix of ON and/or OFF dots, after the analysis by the interpreter; and
